

City of Pittsburgh - I&P Department Collaboration Model

DataTrackers
A5: Individual Consolidated Model

INTRODUCTION

Collaboration Models display the different types of collaboration discovered during each interview. This includes: who interacts with who, what they try to achieve, and what is shared, done, or discussed.

The City of Pittsburgh Department of Innovation and Performance (I&P), supports, maintains, and expands the City's technological infrastructure and works with other departments to improve services and make accessible public information. In order to promote open data sharing across the City's various departments, we are to assist I&P with designing a continuous process that will help departments inventory their datasets in a standardized framework that is compliant with the City's Open Data Ordinance. This will require all departments to increase their collaboration with I&P. This consolidated model delineates some of the current collaborative efforts between I&P and six other Pittsburgh departments. Collaborative processes of this model are based solely on interviews with stakeholders of the departments, which include the Department of Public Works (DoPW), Department of Mobility and Infrastructure (DoMI), Bureau of Police (BoP), Bureau of Fire (BoF), Records Management (RM), and Water and Sewer Authority (W&SA). Overall, the model shows uneven collaborative processes between I&P and other departments, as well as a general lack of awareness of the open data ordinance and open data principles.
